

Years of experience in packaging production.

Holder of ISO certificates

Manufacturer of stretch films and a specialist in the packaging materials segment.

TICHELMANN SK

Films / Packaging Technology / Packaging

Why us

We are a company with a long tradition and professional expertise, established in the year 2000. However, **the people behind the establishment of our company have been involved in packaging production and packaging technologies for decades.**

Thanks to this, we belong among the top manufacturers and specialists in the industrial packaging materials sector.

In 2018, we joined forces with a significant player, a manufacturer of stretch films - the company Pap-pex, and **became the leader in the segment of packaging materials and technologies in Slovakia.** We provide our customers with comprehensive services, advice, and high-quality products.

Thanks to innovations and new trends in manufacturing processes, we are able to produce stretch films with progressively lower amounts of raw materials while maintaining the same level of quality and results. The reduced input costs are reflected in lower prices of the final products.

Above-average warehouse capacities distributed in four cities - Bratislava, Cífer, Veľký Meder, and Topoľčany, our own production lines, and a professional team will convince you of our flexibility and reliability.

We are looking forward to cooperation.

Holder of ISO certificates.

Protected workshop.

Eco-friendly packaging.

TICHELMANN – your partner in packaging.

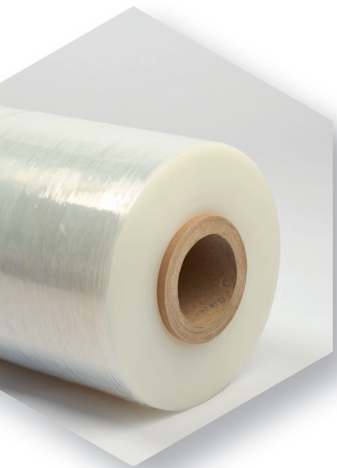

Our TOP products

We manufacture stretch films with the aim of achieving **a perfect balance in quality, performance, price, and environmental impact**. They are characterized by **high resistance to tearing and puncturing**, enabling safe packaging and transportation of both standard and non-standard pallets, products with sharp edges, and protrusions.

Pre-stretched NANO hand stretch film

It excels in low consumption of raw materials, which positively affects the price. **We guarantee significant cost savings on packaging processes**. Available in a transparent version from a thickness of 5.5 microns and in a black version from 8 microns.

Ideal for: large retail chains, big warehouses, and logistic centers with substantial consumption of packaging materials.

FLEXPOWER Elit hand stretch film.

Manufactured in thickness ranging from 8 to 12 microns, FLEXPOWER Elit hand stretch film meets the most demanding packaging requirements. **It has excellent fixing capabilities**, eliminates the risks of damaging goods, and reduces the likelihood of accidents.

Ideal for: packaging products that require high levels of protection during handling and transportation, ensuring safe and damage-free delivery to their destination.

FLEXPOWER Fresh

With just 8 microns and **an ideal film composition that allows contact with food**, it guarantees freshness and is suitable for packaging vegetables, meat, and even for reheating in a microwave or freezing.

NANO machine stretch film

The modern trend in packaging. Professional packaging machines are essential for efficient packaging. **We guarantee up to 40% reduction** in packaging material consumption.

FLEXPOWER Energy machine stretch film

Metalocene coextruded film, 11 - 23 microns thick, with the possibility of pre-stretching up to 250%. It is highly tensile and **can be used on various types of packaging machines** with adjustable pre-stretching.

Packaging for every industry

Bubble wrap - double and triple-layered.

An undemanding and flexible packaging solution **primarily used for cushioning and filling void spaces**, preventing the free movement of goods. **Ideal for packaging easily damaged surfaces**, and thanks to the antistatic version, it is also suitable for the electronics industry.

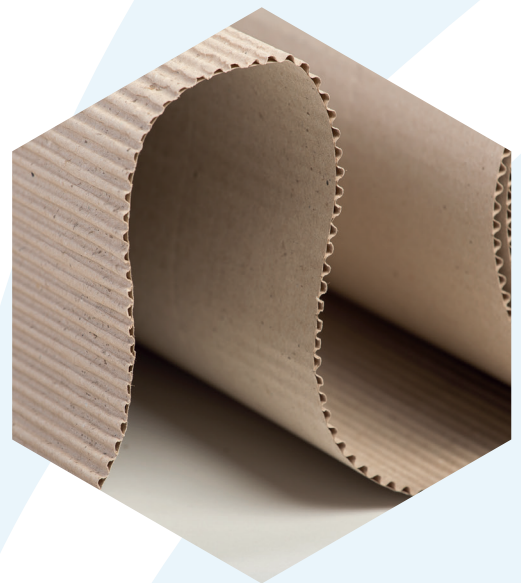

Bags, pouches, envelopes

For individual and piece packaging, fast and secure. **They protect against moisture, contamination, and damage.** Available in various colors, thicknesses, and dimensions, **with the option of printing or resealable systems.**

Cardboard and corrugated packaging

Cardboard boxes and packaging made of corrugated and smooth cardboard are used to complete and package goods that may not require transportation on pallets. **The parameters of the cardboard, type of corrugation, weight, and thickness, perforation or printing** can be precisely tailored to the characteristics of the packaged goods and customer requirements.

Foam film - a lightweight and flexible packaging solution.

Foam film serves as a basic protection against dirt, scratches, and deformation of goods. It is also used as cushioning material inside boxes across a wide range of industrial sectors, particularly in the electrical and automotive industries.

Our tip: When storing goods outdoors, use FLEXPOWER stretch film with UV stabilizer.

Packaging accessories and equipment

Packaging materials supported and equipped with accessories meet the highest safety and protective standards.

Protective corners and edges.

Adhesive tapes – Polypropylene, crepe, double-sided tapes, with and without printing.

Binding tapes and clips.

LDPE films

LDPE bags

HDPE films

To ensure that packaging is simple, fast, convenient, and practical, it is essential to choose suitable packaging equipment.

Stretch film dispensers, which serve as holders during the handling of the film and the packaged goods.

Tape dispensers, ideal for sealing boxes and handling adhesive tapes.

Comprehensive packaging machines for machine stretch film belong to our top packaging technologies. Properly set wrapping intervals, pre-stretching, and height can optimize film consumption, thereby effectively saving company costs.
